Diagnostic Knee Arthroscopy

Arthroscopic surgery allows diagnosis and treatment of joint problems through small incisions in the skin. A camera attached to a scope is used to see inside your joint.
**Diagnostic Arthroscopy Introduction**
Arthroscopic surgery allows diagnosis and treatment of joint problems through small incisions in the skin. A camera attached to a scope is used to see inside your joint.

**Doctor’s Personal Note: A Message From Dr. Pevny**
Thank you for visiting my website and viewing the 3D Animation Library. These animations should assist you in better understanding your condition or procedure. I look forward to answering any additional questions you may have. Please make an appointment by calling (970) 544-1289.

**Incision**
Small incisions (portals) are made around the joint. The scope and surgical instruments will go into these incisions.

**Visualization**
The scope is inserted into the knee. Saline solution flows through a tube (cannula) and into the knee to expand the joint and to improve visualization. The image is sent to a video monitor where the surgeon can see inside the joint.
Diagnosis
Using the video monitor as a guide, the surgeon can make a
diagnosis. A variety of surgical instruments like this probe can be
inserted through other incisions to treat specific problems.

End Of Procedure
The surgical instruments are removed and the procedure is
completed.
