

# Repair of Detached Labrum

The shoulder is a complex multi-directional ball-and-socket joint which allows movement in many directions.

### ***Repair of Detached Labrum Introduction***

The shoulder is a complex multi-directional ball-and-socket joint which allows movement in many directions.

#### **Doctor's Personal Note: A Message From Dr. Pevny**

*Thank you for visiting my website and viewing the 3D Animation Library. These animations should assist you in better understanding your condition or procedure. I look forward to answering any additional questions you may have. Please make an appointment by calling (970) 544-1289.*

### ***Shoulder Instability***

Shoulder instability and dislocation occur when the shoulder capsule is stretched or torn, and/or when the labrum is detached from the glenoid.

### ***Incisions***

Small incisions (portals) are made around the joint. The scope and surgical instruments will go into these incisions.

### ***Visualization***

The scope is inserted into the back of the shoulder joint. Saline solution flows through a tube (cannula) and into the shoulder capsule to expand the joint and to improve visualization. The image is sent to a video monitor where the surgeon can see inside the joint.

### ***Repair***

A surgical instrument is inserted into the joint. It will be used to reattach the labrum to the glenoid using suture and anchor-like devices.

### ***End of Procedure***

After the labrum is reattached, the surgical instruments are removed and the procedure is completed.
